Project Title: Women's Safety Device

Problem:

Women's safety is one of the significant issues in today's society. Instances of harassment and assault against women are frequently observed around us. Despite the establishment of stringent laws, there has been a persistent rise in crimes against women, rather than a decline. Women often feel unsafe when they venture out of their homes.

Solution:

To address the problem of harassment against women, I have developed a safety device designed specifically for women. This device not only acts as a deterrent to potential attackers but also delivers an electric shock to incapacitate them, thereby providing women with an opportunity to escape.

Required Materials:

- Bag
- Shoes
- Battery
- Wires
- Electronic circuit
- Buzzer
- Electronic circuit for a mosquito repellent racket

Procedure:

1. Take a bag and equip it with a GPS system.
2. Install a device in the bag that emits a loud alarm similar to a police siren.
3. Modify a pair of shoes by embedding an electronic circuit in the soles that can deliver an electric shock.
4. Ensure that the bag and shoes are connected to a power source.

Operation:

When a woman leaves her home, she should carry the safety-equipped bag and wear the modified shoes. If she finds herself in a threatening situation, she can activate the alarm system in the bag by pressing a button. Simultaneously, if someone attempts to harass her, she can activate the electronic circuit in the shoes. The electric shock delivered by the shoes will incapacitate the attacker, giving the woman time to escape and seek help.

Usage:

This safety device can be used by women of all ages. It offers an additional layer of security and confidence when they are outside or at their workplace.

Cost-effectiveness:

The device can be made using readily available materials, making it affordable. It can be used in a manner similar to regular bags and shoes, without additional cost.

Conclusion:

The use of this safety device is expected to enhance women's confidence and sense of security. It will enable women to feel safer when venturing out and at their workplaces, thereby contributing to their overall safety and well-being.
